

ABSTRACT OF THE DISCLOSURE

A system and method for call announcement using a typical computing device permits a typical computing device, such as a PDA, to be used more effectively for telephony. In particular, a novel headphones connector and a software program/module being executed by the  
5 computing device are combined together to implement the call announcing method. The system permits the sound output of the computing device to be split in various manners in order to permit the computing device to be operated as a telephony device.
